EcoTrans™

VEGETATION BY NATURE, INNOVATION BY DESIGN.

Fix your erosion control issues permanently, inexpensively, and beautifully with a green solution – EcoTrans™ transition mats. EcoTrans uses modern polymer technology to provide lasting erosion protection.

- **Made entirely with recycled material** – Through the process of “upcycling,” EcoTrans transition mats are created with 100% recycled post-consumer and post-industrial plastic. Not only does that keep waste elements such as detergent bottles, plastic toys, and plastic bottle tops out of landfills, it is also cost-effective.
- **Cleaner water, better performance, and less hassle than rock rip rap** – Vegetation reinforced by EcoTrans mats cleans storm water while providing scour protection, all at a lower typical lifecycle cost than rock rip rap.
- **Innovative design maximizes environmental benefit** – With 50% open area, EcoTrans’ design ensures dense vegetation establishment while providing critical hydraulic protection.
- **Performance backed by rigorous testing** – Just like its big brother ScourStop, EcoTrans underwent extensive testing at the nation’s leading hydraulic testing facility at Colorado State University and passed with flying colors.
